

Waterjet Cutting Service

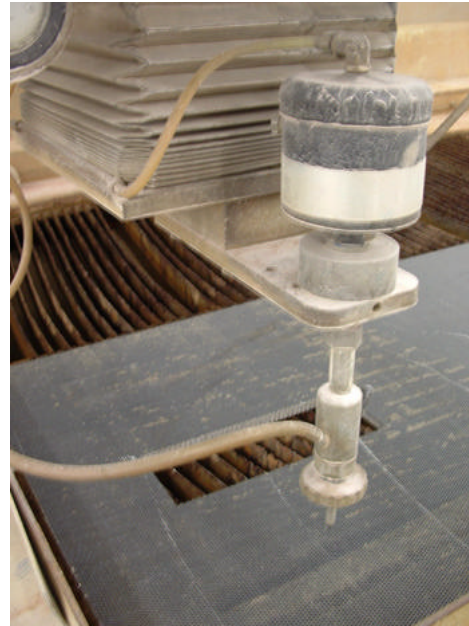

MAJR Products Corp. in Saegertown now offers the FLOW Waterjet System -- "the machine tool of choice" around the world -- for machining high volume, short run , or prototype parts.

The system can cut virtually any shape in a single step with edge quality that usually requires no secondary finishing in a wide range of materials from 1/16 inch to over 8 inches thick.

Abrasivejet cutting is accomplished by a software-controlled robotic motion system -- not hard tooling -- so an infinite variety of shapecutting can be accommodated, from steel, glass and stone to composites, cut net and near-net parts.

Because abrasivejets cut with a narrow kerf and produce no heat, parts can be tightly nested to get the most from raw materials. Time required for setup and fixturing is minimal.
